What can a script be? It is a source of programming instructions intended for your database and other kinds of applications. It consists of a list of commands for specific operations, such as manipulating data, programs or connecting. The commands are organized in a way that makes the script most easy to read and execute. The functionality of a script resides in what it can do and not in how big it is. If a script can do something useful for a person, it is valid. Once you have found the script that meets your needs, you can either execute it directly, or store it in your database. SQL Scriptor is an open-
