People do edit photos with other programs such as Adobe® Photoshop Elements, Adobe® Lightroom, and Apple's Aperture. In this case, be sure to use tools that are

specifically intended for digital editing that can still work in Photoshop. Image editing may have been the bane of traditional printing, but it has become the savior of digital printing. It provides a way to manipulate images to get them ready for the printer. It is vital that the image you are considering using is

ready for print. You need to make sure that the colors, sharpness, resolution, and other printing characteristics are in order. See Chapter 2 to find out more about the various print characteristics. If you need to make changes to your image before printing, this is where you should begin.

Scanning into Photoshop

If you want to use Photoshop to create graphics for a print project, one of the first steps is to scan in your print materials into Photoshop. Photoshop and the programs that are part of the Adobe Creative Suite offer both a flatbed scanner and a Camera Raw (CR) camera-only scanner. The flatbed scanner allows you to

scan negatives, slides, and transparencies. The Camera Raw scanner (which you will be using most of the time) scans your photos or other images in its camera-ready format. It allows you to convert your scanned images from the camera's raw formats into the Photoshop native format. If you have an older version of

Photoshop, it may have only a flatbed scanner, which is fine for a quick scan and conversion, but it's not very practical for working with images at high resolutions. You can use the regular Camera Raw scanner with the newer versions of Photoshop. The Camera Raw interface works just like the regular scanner, but the files produced by

Camera Raw are in the PSD format. With a flatbed scanner, you scan at a resolution of 300 dots per inch (dpi) or fewer. It's hard to find affordable inkjet printers that can produce anything above 300 dpi. With the Camera Raw scanner, you can get a maximum resolution of 4800 dpi. But at this high a resolution, you may

have to crop out some of the picture (see "Crop-ing Out the Background" later in this chapter), which would be a huge loss in quality. At lower resolutions, the crop effect is minimized and you can leave most of the picture in. The differences are apparent as you create images

What's new in the software? After updating to the latest release, you'll notice: Generate PNG profiles by using one or multiple calibrated profiles of your monitor. New Print Preview dialog available in the print menu. Feature

improvements in the crop dialog and shadows & highlights. Changes in the shape tools. New “Free Transform” tool that allows you to rotate, flip, resize, and translate objects. New Edit menu options for resizing and cropping. New adjustment layer (merge layers), new adjustment toolbar buttons, and the erase tool (the first non-

destructive adjustment layer). New stroke area and text tools. Changes in the Character Palette dialog. What's new in the software? Adobe

Photoshop has been keeping up with all the technology, and they have a "big" update coming this year. Here are the updates to Adobe Photoshop 2019 for professionals: Layer

styles can now display their effects in any layer by increasing the pixel density. You can now retouch shadows and highlights directly on image layers, within the layers panel. Adjust layers is now available in the Layer Masks panel. A new map panel has been added to the Layers panel, allowing you to display and edit map

features in real time. Improved support for CMYK, RGB, Lab, and Black & White image types. Photoshop 2019's new Quick Fix panel. New feature for retina displays. The new Gradient tool with the new Pattern Fill and Shape Fill options. New Document Structure panel. Adobe Photoshop 2019 for Professionals

All you need is the sun and you can have all you can eat energy. The most efficient way to get away from solar has always been to simply live in the shade. But Ben Burkhardt's new reactor developed with an assist from atomic physicists could make that too expensive. Burkhardt is

the director of Ohio State University's Solar Energy Research Institute (SERI), which is developing photovoltaic technology (the cell, not the word). He describes his "soloronic" reaction chamber as a 2-foot-diameter tube of glass filled with liquid sodium. When sunlight enters the tube it heats up to 3,500 degrees Fahrenheit. Then

the sodium is siphoned to one end of the tube and a reaction begins. The sodium mixes with oxygen (an industrial chemical used in the manufacture of cement) to make sodium peroxide - which, BURKKARDt explains, "looks like water, but glows like a fluorescent ball light." The sodium peroxide then moves to the other

end of the tube where it combines with hydrogen to make sodium metal. Burkhardt says the reaction can generate electricity and heat without using any moving parts or moving gases. But the trick, Burkhardt argues, is the power of the sun. "This is a closed-cycle energy system that can be scaled up in size to produce large amounts

of electricity," he says. "[And] a closed-cycle heat system can capture the heat from a nuclear reactor and release it in a controlled fashion for use in other systems." The solar reactor could be used on rooftops or on a large scale for industry, Burkhardt says. Ideally, the reactor could be designed to do double duty: produce electricity

and deliver hot water. But it would be difficult to create a system like Burkhardt's that would capture heat and electricity simultaneously. Other reactors have to have some sort of moving parts, and that would defeat the object of the solar reactor. In the last few years, Burkhardt's lab has discovered a way

to get around that problem. The lab has developed a concentrated solar reactor that produces "hybrid" electricity and heat. In this reactor, part of the reactor gets hot enough to allow the heat to drive a moving "hot gas" through the reactor. The hybrid reactor runs more efficiently and more continuously than

existing solar reactors, he says. The technology has been patented, and SERI is developing the technology to achieve commercialization.

About Me My name is Mandy & I'm a photographer. I started out in 2006 as a hobby,

but after a while I started to enjoy it, so I made it my profession in 2011. I love taking pictures of all aspects of the world around me - landscapes, animals, people and more. I especially love photographing people!

Tuesday, 30 December 2011 A little present from me I've said it before and I'll say it again - I love Christmas. I love

Christmas light displays, presents, yummy food, laughter, football and partying. And last week I was surprised to receive the most exciting present ever – some beautiful photographs from a local artist. I've only heard of her once before, and we didn't exchange emails, but after her work was displayed in an art gallery I wanted to know

more about her and I was able to grab a nice photo which I've framed and am looking forward to hanging on my wall.

Merry Christmas Mandy, and I hope your day is as special as you expect it to be. Happy New Year also!

Strong pinning of lattice disorder and antiferromagnetic correlations in superconducting

cuprates. The superconducting gap and incommensurate neutron scattering rate of the doped Mott insulator $\text{Nd}_2\text{BaNiO}_5$ reveal pinned static magnetic impurities. Additional power law scattering and residual thermal conductivity reveal antiferromagnetic correlation lengths $> 5 \text{ \AA}$. These results point to an

inhomogeneous charge distribution in $\text{Nd}_2\text{BaNiO}_5$. In the superconducting cuprates, NMR and photoemission data imply that dopants are located around Zn impurities, and the local lattice disorder is linked to the magnetic scattering.

Q: Filter out digits in I2C register read This program is a part of an

exercise in Chapter 5.4 of Dr.Dobb's Guide to Embedded Programming. I am trying to read the eight-bit word b001001 that is presented by the slave device. The slave device is a simple DAC that outputs the value stored in register b. The register is presented to the sender by a 13.56MHz analog waveform in the form of

a PWM signal. The sender responds by writing the register value to the register on the slave. The exercise requires me to read the register and then print it out on serial. This
