I'm using CoreData (on Snow Leopard) in my Cocoa application and the sample projects with Xcode are great, but I want to know of a good way to make use of the CoreData framework. I'm looking for advice that is either based on personal experience or on discussions around the use of CoreData. I've got experience with SQLite and CoreData to date. However, I'm sure that SQLite is not the best way to do it. Please point me to some sample code or some good ways to implement CoreData on OS X. A: I'm biased, but I've been writing a framework to use Core Data on iOS and OS X with "zero code on the side." It's called RestKit and it's free and open source. It works with Core Data in a very declarative and object-oriented way, and makes working with Core Data very painless. It requires no code on the part of the client. A: XCode has a sample application called "Core Data Application" which shows you how to create and use a Core Data database and

entity model. It's a free application, and very easy to understand. You may be able to get a good idea of how to model your data, as well. Q: How do I split an object stored inside another object and store only a part of the object in an Array? I have an object inside an object. var
obj = [{ time: "04:30" }, { time: "05:30" }, {
