Right about now you might be saying to yourself, "I say, that's not fair, \_\_\_\_\_! I haven't touched the program for years!" Perhaps you use the new and improved Photoshop in your graphic design work, or maybe you just simply keep using the original version because you just can't get over what it did for your photo editing and it's still so easy to use. If you use Photoshop on a daily basis, or use it nearly every day, then you maybe might want to consider getting the new version of Photoshop, if you weren't planning on upgrading any time soon. When it comes to new features, the top three most requested ones are in this category: Content Aware Fill, Content Aware Move and Content-Aware Crop. I like what Photoshop did with these three. First, they address the most common concerns of most users — they feel like Photoshop is an enigma because it performs tasks they'd like to be able to do without all the options in the Content-Aware dialogs. I will say one thing: Adobe added some very useful features to the software they sell. You can now drive the Spot Removal tool with a keyboard, for example, and you can import data-stored files directly into Lightroom. Apart from not being able to create decent print layouts while using these tools, it's a nice gimmick. There is also the ability to place guides with the pen tool, for example, which makes sense if you've ever needed any of those. I was also not aware of such things before, but they do seem like small ideas with big results. As one of the largest visual design and production companies today, you can't not notice them.

When Adobe replaced the rectangular Selection tool with its new freeform Rectangular Selection tool, it also hinted that more to come. Adding to the tool's functionality, Adobe is planning to add a powerful feature that will automatically crop away areas of an image you don't want. This crop will work with the native crop tool, extended crop tool and with no tool active, so you're not constrained in cropping by any external tools. The crop tool will also be more flexible, with the tool going beyond stippling to help you crop out some areas of the image, although this may change. The Fill Effects feature we revealed back in January from Photoshop has been fleshed out with more options, and details appear to be in order. One of the most eye-catching is that you can switch which Fill Effects is applied to an image, using a two-click system. Not only does this mean you can create some very original effects in the software with ease, but you can also test multiple effects and choose the one that looks best by comparing your original content against the option that fits best. Fill Effects is set as layers, so if you have lots of elements in your image to choose from, you can see what effects work best before applying them - and with the ability to set each layer as its own effect, you can have several effects on one feature. Fill Effects is only available in Adobe Photoshop, however. In this case, it's a matter of replacing existing apis in a new, native loader to fully native techniques. This means that we're able to expose 3D graphics directly to the GPU, instead of packaging these as texture maps and vertices that then are transferred over to a 3D rendering stage. This change will affect only Photoshop CS6 and is part of the 3D worldspace loader revamp. For those unfamiliar with

this technology, below are a few examples of some of the most used techniques.
