This is how the defaulted behavior before the update. The image on the right is after the update. Now the image on the top of the green frame is to the right, and the image on the left of the red frame is to the top. This may be minor feature, but it's a welcome addition to the StreetLens feature (and only the two other places this is possible are on street corners, down the sides of buildings, and corners of buildings). With SevenLens, you can also switch between lenses and the effect on the photo is the same. Lightroom 5 is a notable upgrade and it's going to be too soon to determine if it will be a step forward or backward. The program's included with Photoshop Elements 2021, and there's no way to get a standalone Lightroom 5. We already have a good idea of all the new features, so let's see how the new user interface performs. It's a bit confusing at first, especially if you're not familiar with the layout of the user interface. When you open the Photoshop window, it's just like the usual Photoshop, except a bunch of new, important features are hidden. If you're a person who likes to look at icons and buttons, then you're just going to hate the new interface. If you like to work with paintings and photos, then you'll probably like the new interface. The new tools and menus are easily remembered, but you may not always know which tools do what. The toolbar is darker, with a new row with recently used tools (May not be there in lower versions), and the Photoshop interface has convenient shortcuts. The

Workspace can now be moved to a different monitor if you wish. You have the option of placing the window wherever you like on the screen, but not making it secondary unless you place it on another monitor. You can also show and hide buttons, menus and windows on the canvas by clicking the icons that are on the right side of the status bar.
